## B. Course Objectives and Learning Outcomes

### 1. Course Description

Multivariable calculus is the third and the final part of the standard three-semester calculus sequence. It represent the extension of calculus in one variable to calculus with functions of several variables. This course treats topics related to differential calculus in several variables, integration in several variables and vector calculus. Multivariable calculus has many applications in various areas such as pure mathematics, engineering and physics.

## 2. Course Main Objective

The aim of this course is to provide students with fundamental concepts and techniques of multivariable calculus and to develop student understanding and skills for its applications to other areas.

## 3. Course Learning Outcomes

1.1	Recognize mathematical formulas and methods of derivation of multivariable functions.	
1.2	State the integration techniques to calculate multiple integrals in different coordinate systems.	
1.3	Memorize the different theorems of vector calculus.	
2	<b>Skills :</b>	
2.1	Perform differential calculus operations on functions of several variables including continuity, partial derivatives and directional derivatives.
