Special Topics in Electronics and Communications (8024990)

Term 1; 2021/2022 Homework 6

Dr. Waheed Ahmad Younis

Do not submit this homework. There will be a quiz from this homework on Thursday (Oct 21, 2021).

Topics covered in this week:

- Butterworth (maximally flat) LP filter design
 - o Identifying the pole location
 - o Forming the proper denominator polynomial (1st and 2nd order expressions)
 - o Designing the filter using op-amps and resistors, capacitors
- Magnitude function of Butterworth filter of order n

$$|G(j\omega)| = \frac{1}{\sqrt{1 + (\omega/\omega_0)^{2n}}}$$
 $20 \log|G(j\omega)| = G_{dB} = -10 \log[1 + (\omega/\omega_0)^{2n}]$

• Filter design based on given specifications

Given: ω_p , ω_s , G_{min} and G_{max}

find ω_0 and n

$$\omega_0 = \frac{\omega}{[10^{-G_{dB}/10} - 1]^{1/2n}} \qquad and \qquad n = \frac{\log \left[\frac{(10^{-G_{min}/10} - 1)}{(10^{-G_{max}/10} - 1)} \right]}{2 \log \left(\frac{\omega_p}{\omega_s} \right)}$$

- Filter designing using frequency scaling and impedance scaling.
 - o Design the filter for a normalized frequency of 1 rad/s
 - \circ Frequency scale by dividing L and C by ω_0 .
 - o Impedance scale by multiplying R and L by some factor Z and divide C by same factor Z.
- Design of Butterworth HP filter
 - Design the corresponding LP filter first
 - Interchange Rs and Cs with appropriate values
 - o Properly scale (frequency scale and impedance scale) to get the real circuit

Q1. You have to design a Butterworth LP filter. Passband should be up to 2.5 kHz. Stopband should be above 3.5 kHz. In the passband, filter gain should not be below -0.4 dB and in stopband, the filter gain should not be more than -30 dB. Find the order of the required filter and a proper choice of ω_0 .

Solution:

Given:

$$\begin{split} \omega_p &= 2\pi(2,\!500) \text{ rad/s} \\ \omega_s &= 2\pi(3,\!500) \text{ rad/s} \\ G_{min} &= -0.4 \ dB \\ G_{max} &= -30 \ dB \\ n &= \frac{\log \left[\frac{(10^{-G} min^{/10} - 1)}{(10^{-G} max^{/10} - 1)}\right]}{2\log \binom{\omega p}{\omega s}} = \frac{\log \left[\frac{(10^{0.4/10} - 1)}{(10^{30/10} - 1)}\right]}{2\log (2.5/3.5)} = 13.74 \quad \text{So, n = 14.} \end{split}$$

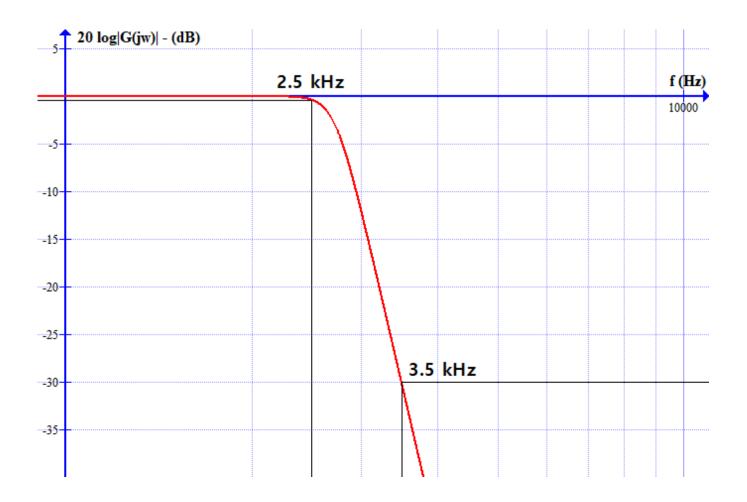

Using ω_n :

$$f_0 = \frac{f}{\left[10^{-G}dB^{/10} - 1\right]^{1/2n}} = \frac{f_p}{\left[10^{-G}min^{/10} - 1\right]^{1/2n}} = \frac{2,500}{\left[10^{0.4/10} - 1\right]^{1/28}} = 2.718 \text{ kHz}$$

Using ω_s :

$$f_0 = \frac{f}{\left[10^{-G}dB^{/10} - 1\right]^{1/2n}} = \frac{f_S}{\left[10^{-G}max/^{10} - 1\right]^{1/2n}} = \frac{3,500}{\left[10^{30/10} - 1\right]^{1/28}} = 2.735 \text{ kHz}$$

We recommend using: $f_0 = 2.726 \text{ kHz}$

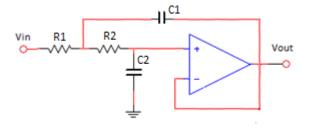

Q2. Consider a normalized Sallen-Key circuit with the following component values:

$$R_1 = R_2 = 1 \,\Omega$$

$$C_1 = 2Q F, \quad C_2 = \frac{1}{20} F$$

Perform proper scaling and design a 2nd order LP filter with Q = 1.2 and cut-off frequency 2.3 kHz.

Solution:

Initial (normalized values):

$$R_1 = R_2 = 1 \Omega$$

$$\begin{array}{l} R_1 = R_2 = 1 \, \Omega \\ C_1 = 2.4 \, F, \quad C_2 = 0.4167 F \end{array}$$

After frequency scaling:

$$R_1 = R_2 = 1 \,\Omega$$

$$C_1 = 166 \ \mu F, \quad C_2 = 28.832 \ \mu F$$

After impedance scaling:

$$R_1 = R_2 = 1 \, k\Omega$$

$$R_1 = R_2 = 1 k\Omega$$

 $C_1 = 0.166 \mu F$, $C_2 = 0.0288 \mu F$

Q3. Design a 2^{nd} order HP filter with Q = 0.8 and cut-off frequency 1.3 kHz.

Solution:

Consider the LP Sallen-Key circuit normalized to $\omega_0=1$.

Transfer function for this circuit is $G(s) = \frac{1}{s^2 + \frac{s}{Q} + 1}$

Interchanging Cs and Rs, we get the circuit for HP filter with transfer function

$$G(s) = \frac{s^2}{s^2 + \frac{s}{Q} + 1}$$

Let us calculate the component values for this HP filter: Initial (normalized values):

$$C_1 = C_2 = 1 \text{ F}$$

 $R_1 = 0.625 \Omega$, $R_2 = 1.6 \Omega$

After frequency scaling:

$$C_1 = C_2 = 122.43 \ \mu \text{F}$$

 $R_1 = 0.625 \ \Omega, \quad R_2 = 1.6 \ \Omega$

After impedance scaling:

$$C_1 = C_2 = 0.122 \,\mu\text{F}$$

 $R_1 = 625 \,\Omega, \quad R_2 = 1.6 \,k\Omega$
