## Abstract:

This study displays a method that assists students in quickly searching for lost belongings, saving time and effort and reducing their reliance on security personnel. Direct messaging will be the primary technology employed in this system. Our application's direct messages will contain information about missing items between the advertiser and the owner of the lost item, as well as other services provided by the app, such as allowing immediate receipt of lost items, adding new missing items, or searching for the missing item to find out all the details about it. Our system will support Android, and in the future, we will develop it to support IOS. We will use the Java programming language to establish a database and enter data into it using SQL.

## Methodology:

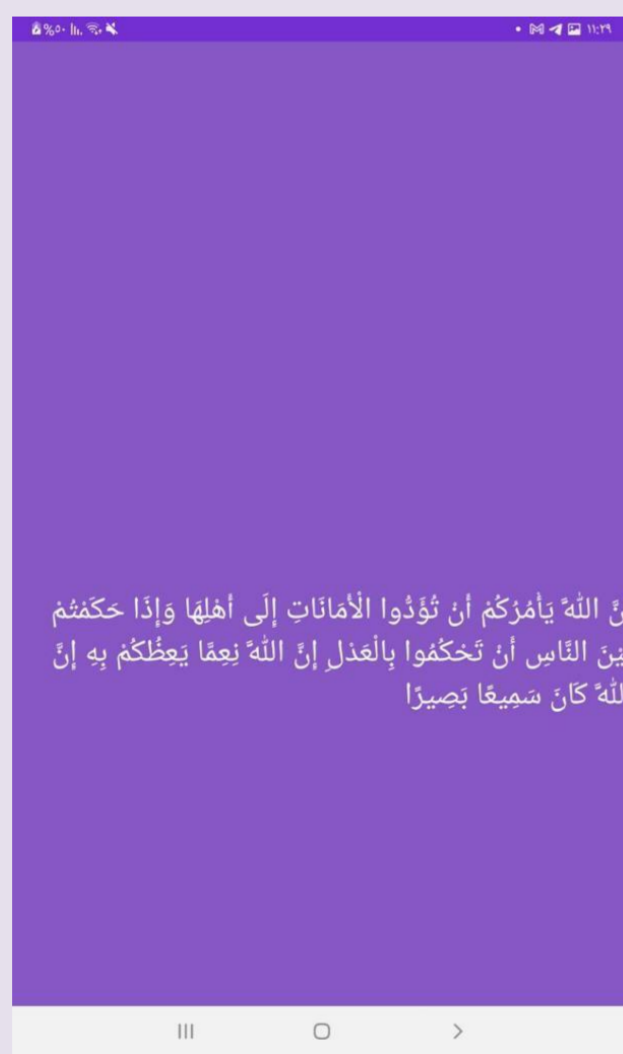

## Objective:

The main objective of the project is to help Umm Al-Qura students search for their lost items in an easy and fast way, where students can place advertisements for missing items, and students can interact with the publication using the comments feature, If the missing item if you find, the advertiser contacts the owner of the lost item and determines the place of delivery of the item. advertising can modify in the event of the missing item delivered to its owner.

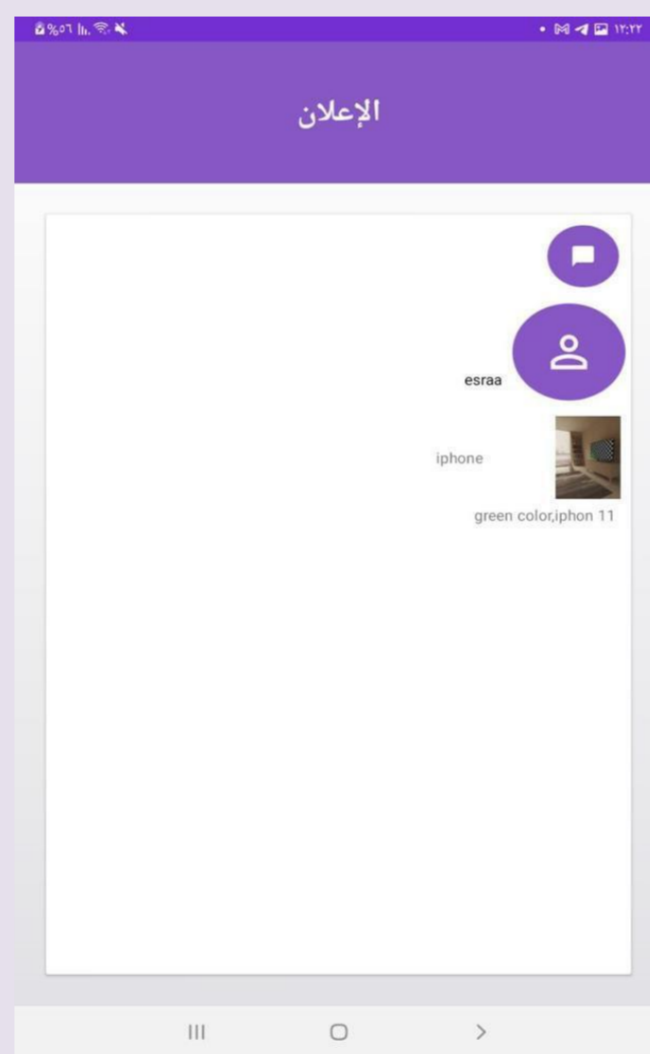

## Purpose Of Project:

We are looking for a better way to search for missing items within the university because it is difficult to search every building for the missing item or ask students about the missing item. From there, we developed the concept for our project, which is to provide easy access to the lost object and dedicate this application to all UQU students in order to increase the chances of finding the missing item through the system's advertisements. Students at Umm Al-Qura University can either announce the missing item or search for it based on a specific classification. This application works by sending alerts to all students who have registered with it.

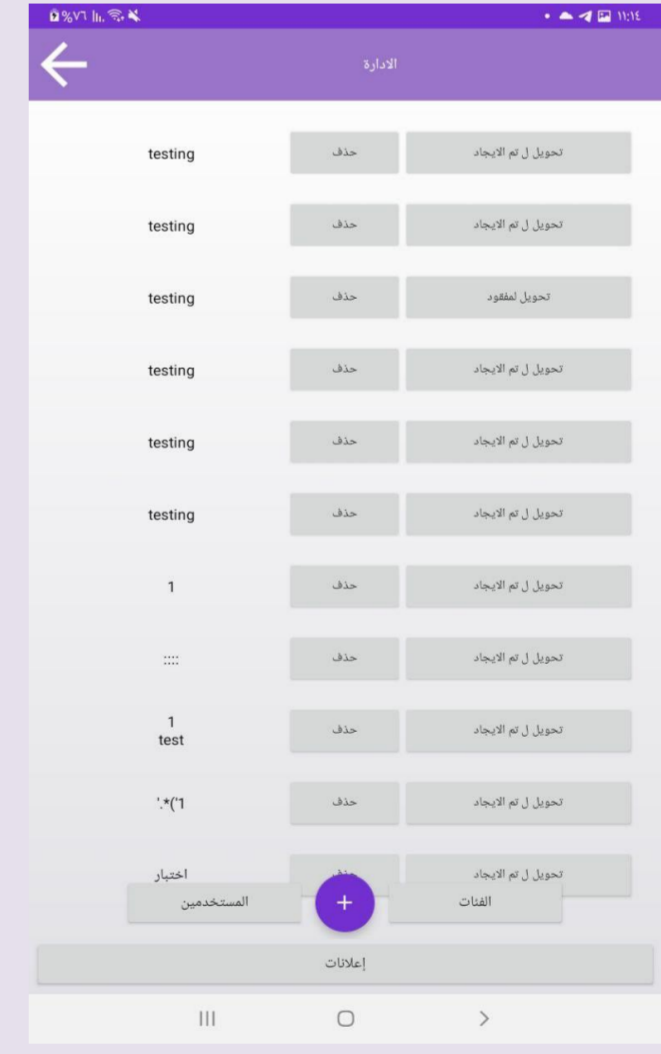

## Results:

## Tools:

## Conclusion:

In view of the problems that Umm Al-Qura University students and staff face in finding lost items, we have provided this application as a solution to help them find lost items easily and conveniently, as the application allows the user to see their own ads. Lost and Found, as well as the ability to speak with the advertiser through message.
