**Introduction 1**

With the advancement of technology, current attendance methods contain some problems. Thus, we produced an idea that utilizes the biometric fingerprint card and an application on the cell phone which is going to be an enhancement over the current methods and solve most of its problems.

**Objectivs 2**

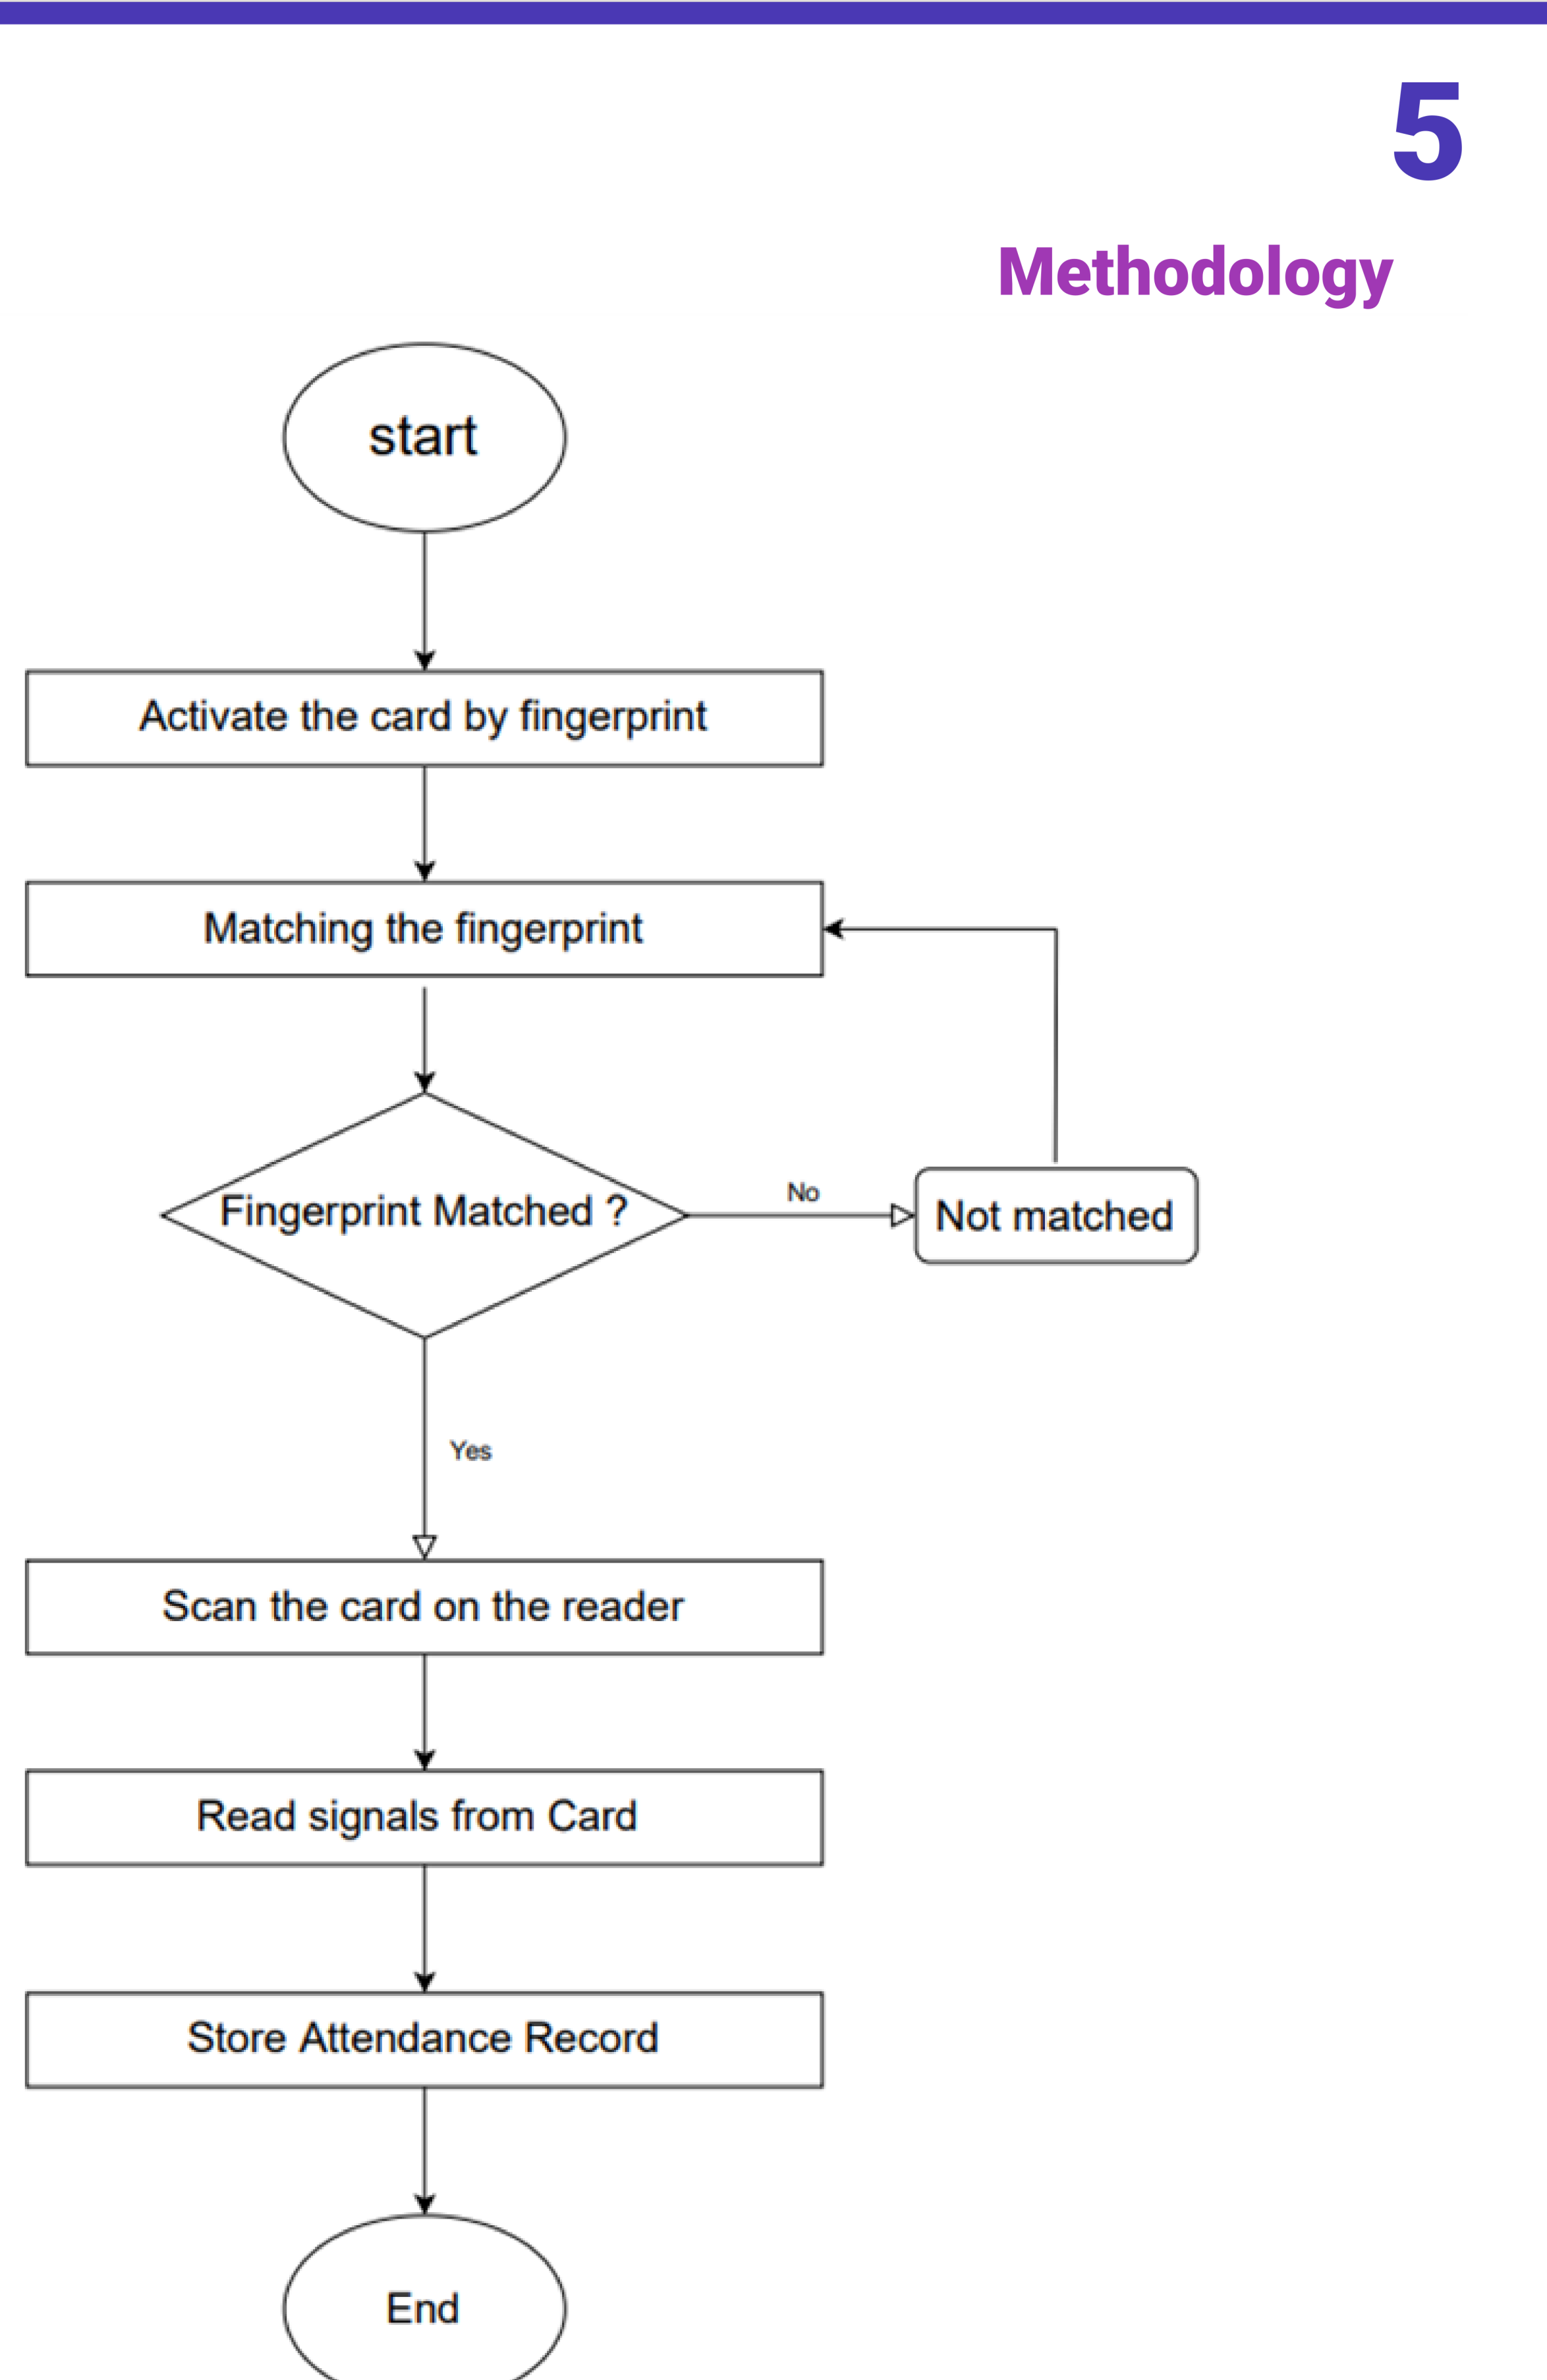

- Cost-efficient
- Privacy insurance
- Minimize queue delay
- System useability

**Problems Identification 3**

- Privacy
- Security
- Infection spread

**Conclude Results 4**

Everything worked fine, except for attendance through the mobile app, due to the different types of NFC that every mobile phone needs and needs a Complex program to take the data from the mobile.

**Conclusion 6**

Our system is a biometric attendance system reading tags we have used RFID Cards with embedded fingerprint sensor and mobile app that are a big different from other methods, our project will focus on being cost-effective and better performance, more reliable, and more secure since we use the fingerprint sensor.
