Introduction

we worked on defining the problem, defining its scope, and creating a system to deal with it. To facilitate the work, we have set some goals that will help us in carrying out this project, as well as the requirements and resources that we will need

Product Scope

- Save time and effort for customer and worker
- Work performance guarantee
- Preserving the rights of both parties
- Facilitating the performance of work for workers
- Save money
- Spread and Marketing for Employers

Methodology

We found that agile methods are better than waterfall in our system because the project can be divided into several phases and improved at each stage, requirements, plans and results will be evaluated continuously

There will be communication between customers, developers and managers
